

Replication synchronizes all MSF sources ongoing with MSF Server. All MSF workstations are always on the same data level (merge replication).

Data from front-end MSF will be replicated to SQLSERVER and after passing several procedures (night), to USER databases (only individual extracts). User databases will be replaced every night, therefore no direct data changes possible for end-users (one-way).

USER Workstations (read only)

USER Workstations (read only)

User DB's are always ,isles' with individual data
